I have a number of different enums with the same set of values. I'd like to be able to define them in a single file, so that I can keep them all in sync, and use an extension method to allow me to refer to the enum value by name. But I get the following error: error CS0201: Duplicate definition for enum 'enumName' The enum is defined within a separate.cs file. enum SomeEnum { enumName = 1, enumNameTwo = 2, enumNameThree = 3, enumNameFour = 4 } Are there any workarounds for this? A: Yes. You have to put each enum definition in its own namespace. E.g.: namespace MyNamespace { enum SomeEnum { enumName = 1, enumNameTwo = 2, enumNameThree = 3, enumNameFour = 4 } } A: A namespace is a type. namespace MyEnum { enum SomeEnum { enumName = 1, enumNameTwo = 2, enumNameThree = 3, enumNameFour = 4 } } A: You need to put them in separate namespaces

TraceTool is a handy and reliable utility that was designed to be a C#, C++, Delphi, ActiveX and Java trace framework and trace viewer. The application offers Tail, outputDebugString, event log, and with Log4J, Log4Net, and Microsoft EIF support. This also comes with full support for Pocket PC development (C++ and DotNet). TraceTool features The.NET, Delphi and ActiveX application supports over 50 trace methods to output data to a console, application log file, event log, database or a remote client. Trace data can be displayed in real time or as an instantaneous log file which is stored in a database, xml file or can be sent to a remote client. The application also supports full support for writing to a remote client using.NET's remoting capabilities. The Pocket PC applications supports a much smaller set of trace methods including the 2 trace methods Tail and outputDebugString. The application can be customized to the Pocket PC with full support for Visual Studio. There is no limit to the number of applications you can create for your Pocket PC. The application is fully functional in Delphi. Full source code is provided. TRACE commands 1) Sets or changes the font of the output.
